

Python Tip: `enumerate()`

Need both an item's **index** and its **value**?

Use `enumerate()` to get both without managing a counter yourself!

The Manual Way

You could create and update a counter yourself, but that adds extra bookkeeping.

```
languages = ["Python", "SQL", "JavaScript"]  
  
index = 0  
for language in languages:  
    print(index, language)  
    index += 1
```

```
0 Python  
1 SQL  
2 JavaScript
```

Using `enumerate()`

`enumerate()` produces an index and value for each item.

```
languages = ["Python", "SQL", "JavaScript"]  
  
for index, language in enumerate(languages):  
    print(index, language)
```

```
0 Python  
1 SQL  
2 JavaScript
```

The indices start at `0`, just like list indexes.

Choosing a Starting Number

Pass `start=1` to choose the starting index.

```
tasks = ["Plan", "Build", "Test"]  
  
for number, task in enumerate(tasks, start=1):  
    print(f"{number}. {task}")
```

1. Plan
2. Build
3. Test

Wrap-Up

Now you know how to use `enumerate()` to loop over both the index and the value of a list in Python.

Follow me for more tips.
